

This message spell is quite simple. in telepathy you send out voice impressions at a ultra low frequency physically, as, the waves hardly affect anything, but, the 'signal' is still caught. this is like gamma radiation 'penetrating' materials and going through. actually, i doubt it is actual radiation, but, rather a vector of noise, yes? the thing is, everyone can hear it that i have heard of, so, it would stand to reason to say it still goes through things, so, has no mass? that is impossible! everything that affects other things, like the nerves in your ears, has mass. so, it must have mass, yet it goes through things with mass, and, therefore must be like radiation of some sort.

*Sound insulation: prevent the transmission of noise by the introduction of a mass barrier. Common materials have high-density properties such as brick, thick glass, concrete, metal etc. Sound absorption: a porous material which acts as a 'noise sponge' by converting the sound energy into heat within the material. Common sound absorption materials include decoupled lead-based tiles, open cell foams and fiberglass. Vibration damping: applicable for large vibrating surfaces. The damping mechanism works by extracting the vibration energy from the thin sheet and dissipating it as heat. A common material is sound deadened steel. Vibration isolation: prevents transmission of vibration energy from a source to a receiver by introducing a flexible element or a physical break. Common vibration isolators are springs, rubber mounts, cork etc.*

Now, the ways to control noise must be reversed to get clear messages across. this can be done by shouting in telepathy, or, 'focusing' your message totally. there is actually a lot of noise out there for me, and i have trouble finding out where it comes from. so, this will be more like a 'filter,' yes?

Well, if you were to imagine a filter of some "thin sheet and dissipating it as heat." that could be one method. if you were to think of this, then you could master it in your mind, and filter out noise from telepathy rooms, well, that is what i have heard, of course.

To actually send a 'message,' you will need to think of the person, and then imagine a string between you and them. this is like a typical old telephone with two cups and one string between them. the string must be imagined by the two people involved, and then they could converse for a while.

Of course, proving there is telepathy is quite hard, seeing as how people can just say they do not believe, yes? i mean, if someone threatens you over your 'telepathy channels,' how do you take them to court? you will need people with you to agree with you, but, what about if you are unpopular and demand rights?

For this, there needs to be a machine that proves there is telepathy. this means we need to take a room full of people that do not agree with this, and catch them using it. these will be minor 'phonic vibrations' from their throats to make it as if it were a noise, while obviously there is a distortion of some kind, yes?

So, we need to use a voice recorder, a normal dictaphone, and then record the breathing of the deniers. this will be where they all speak to each other about how stupid this is, and then get recorded 'muttering' to themselves. or, you could say what it is you want to say to be recorded, and then get a scientist to uncover the recordings on the microphone, yes?

If we were to record a bunch of breathing, we can go to the root of it all by getting it into another room. this will be where the recorder will record the breathing in the other room, or, the vibrations of the throat, yes?
